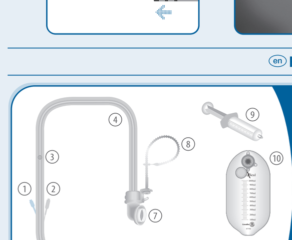
## ENGLISH



1. Catheter Irrigation and Medication Port
2. Balloon Inflation Port with Fill Indicator
3. Sampling Port
4. Catheter
5. Position Indicator Line
6. Low-Pressure Retention Balloon with Finger Pocket
7. Connector
8. Hanging Strap
9. Luer-lock Syringe
10. Collection Bag with Integrated Cap
11. Cinch Clamp

**Product Description**
**The Flexi-Seal™ SIGNAL™ Faecal Management System contains:**
**1 soft catheter tube assembly, 1 Luer-Lock syringe, 3 collection bags with filter and 1 cinch clamp (Figure 1)**

The soft catheter is inserted into the rectum for faecal management to contain and divert faecal waste in order to protect the patient's skin and keep the bedding clean. There is a low-pressure retention balloon at the distal end and a connector for attaching the collection bag at the other end. There is a recess under the balloon for the clinician's finger allowing the device to be positioned digitally.

A blue and a white port are attached to the side of the catheter. The white port, marked "≤45ml" is used to inflate the retention balloon after the device has been inserted into the patient's rectum. (Figure 2-1b) This white inflation port also provides a visual and tactile indication as to when the low pressure retention balloon is filled to its optimal volume. The blue port, marked "IRRIG./Rx" is used to flush the device if needed and administer medication, if prescribed. (Figure 2-1a)

**Intended Clinical Benefit**
As determined by the available data, the clinical benefits of the Flexi-Seal™ FMS family of products include:
- Containment and diversion of faecal matter
- The enablement of being able to administer medication

**Claims**
In addition to the safety and performance claims relating to the safe use of the device, performance claims made for the device include:
- A product shelf life of 5 years
- The collection bag shall have 1 litre volume capacity.
- The Collection Bag shall have volume graduation marking ranging from 100 ml to 1,000 ml with an accuracy of ± 15%.

**Indications**
For use to manage faecal incontinence through the collection of liquid to semi-liquid stool and to provide access to administer medications.

**Contraindications**
1. This product is not intended for use
- for more than 29 consecutive days
- for paediatric patients (patients under 18 years of age) as its use has not been tested in this population

2. The Flexi-Seal™ SIGNAL™ Faecal Management System should not be used on individuals who
- have suspected or confirmed rectal mucosal impairment, i.e. severe proctitis, ischemic proctitis, mucosal ulcerations
- have had rectal surgery within the last year
- have any rectal or anal injury
- have hemorrhoids of significant size and/or symptoms
- have a rectal or anal stricture or stenosis
- have a suspected or confirmed rectal/anal tumor
- have any in-dwelling rectal or anal device (e.g. thermometer) or delivery mechanism (e.g. suppositories or enemas) in place
- are sensitive to or who have had an allergic reaction to any component within the system

**Warnings**
- **Warning:** Clinicians should be aware that there are very limited clinical data on the use of in-dwelling faecal management systems after 14 days continued use.
- **Warning:** There is a potential risk of misconnections with connectors from other healthcare applications, such as intravenous equipment, breathing and driving gas systems, urethral / urinary, limb cuff inflation neuraxial devices and other enteral and gastric applications.

Not following these instructions for use may increase the likelihood of an adverse event. There is a danger of faecal obstructions with this product.

**Precautions and Observations**
1. Close attention should be exercised with the use of the device in patients who have inflammatory bowel conditions or who have had rectal surgery. The physician should determine the degree and location of inflammation or extent of surgery (e.g. location of anastomosis) within the colon/rectum prior to considering use of this device in patients with such conditions.
2. **Care should be exercised in using this device in patients who have a tendency to bleed from either anti-coagulant / antiplatelet therapy or underlying disease.** If signs of rectal bleeding occur, remove the device immediately and notify a physician.
3. The device should be used with caution in patients with spinal cord injury because of the possibility of the development of autonomic dysreflexia.
4. Remove any indwelling or anal device prior to insertion of the Flexi-Seal™ SIGNAL™ FMS and do not insert any other devices into the rectum while the Flexi-Seal™ SIGNAL™ FMS is in place.
5. Notify a physician immediately if any of the following occur:
- Rectal pain
- Rectal bleeding
- Abdominal symptoms such as distension/pain
6. Ensure that the patient does not lie or sit on the catheter as this could lead to localised pressure damage and contribute to the development of anal skin breakdown and/or restrict faecal flow.
7. Solid or soft-formed stool cannot pass through the catheter and will obstruct the opening. The use of the device is not indicated for solid or soft-formed stool.
8. Small amounts of moisture or seepage around the catheter is anticipated. To avoid skin irritation, initiate an appropriate institutional skin care protocol. At a minimum, the skin should be kept clean, dry and protected with a moisture barrier product.
9. If the catheter becomes blocked with faeces, it can be rinsed with water using the irrigation port only (see Direction for Use "Irrigation of the Device"). **Do not use the white inflation port (marked "≤45ml") to irrigate. If obstruction of the catheter is due to solid stool, use of the device should be discontinued.**
10. **Clinicians should take extra care to use the blue irrigation/medication port (Figure 7-1a) only when irrigating and delivering medication. DO NOT irrigate or administer medication through the white inflation port (marked "≤45ml" Figure 7-1b).**
11. Discontinue the use of the device if the patient's bowel control, consistency and frequency of stool begin to return to normal.
12. As long as the patient is regularly and closely monitored at all times, patients may be seated for short periods i.e. for up to 2 hours, as part of daily nursing care. During this period of seating, regular monitoring should be made to ensure the tubing is never blocked or kinked and to check for and avoid pressure damage to the anal/peri-anal region. For some patients, the length of the period of seating to avoid pressure damage to the anal/peri-anal region could be much shorter and the clinician should be alert to this possibility.
13. As with the use of any rectal device, the following adverse events could occur:
- Leakage of stool around the device
- Rectal/anal bleeding due to pressure necrosis or ulceration of rectal or anal mucosa
- Peri-anal skin breakdown
- Temporary loss of anal sphincter muscle tone
- Infection
- Bowel obstruction
- Perforation of the bowel
14. This device is for single use only and should not be re-used. Re-use may lead to increased risk of infection or cross contamination. Physical properties of the device may no longer be optimal for intended use.
15. If during the use of this device or as a result of its use a serious incident has occurred, please report it to the manufacturer and to your national authority. Circumstances in which the user should consult a health care professional.
16. After use, this product may be a potential biohazard. Handle and dispose of in accordance with accepted medical practice and applicable local laws and regulations.

**Directions for Use**
**A. Preparation of Device**
1. In addition to the device system, gloves and lubricant will be required.
2. Unfold the length of the catheter to lay it flat on the bed, extending the collection bag toward the foot of the bed.
3. Securely attach the collection bag to the connector at the end of the catheter. (Figure 3)

**B. Preparation of Patient**
1. Position the patient in left side lying position; if unable to tolerate, position the patient so access to the rectum is possible.
2. Remove any in-dwelling or anal device prior to insertion of the Flexi-Seal™ SIGNAL™ device.
3. Perform a digital rectal exam to evaluate suitability for insertion of device.

**C. Insertion of Device**
1. Using the syringe provided, remove the air that is in the balloon by attaching the syringe to the white inflation port (marked "≤45ml") and withdrawing the plunger. Remove the supplied syringe and fill it with 45ml of water or saline and connect the syringe to the white inflation port of the catheter. Insert a lubricated gloved finger into the blue finger pocket for digital guidance during device insertion (the finger pocket is located above the position indicator line). (Figure 4)

Coat the balloon end of the catheter with lubricant. Grasp the catheter and gently insert the balloon end through the anal sphincter until the balloon is beyond the external orifice and well inside the rectal vault. The finger may be removed or remain in place in the rectum during initial balloon inflation.

2. Inflate the balloon with up to 45ml of fluid by slowly depressing the syringe plunger. With the insertion finger removed, the SIGNAL™ dome will indicate once the balloon has reached the optimal fill level for the anatomy. (Figure 5) There may be cases where the SIGNAL™ dome will not indicate if the space in the rectum is large. **Under no circumstances should the balloon be inflated with more than 45ml of fluid.** If the SIGNAL™ dome inflates at less than 30ml of fluid, withdraw the fluid and reposition the balloon in the rectal vault. After repositioning, fill the balloon as specified above. **Do not fill with more than 45ml of fluid.** Over inflation of the retention balloon has the potential to increase the risk of adverse events including rectal pain, bleeding, ulcerations, and possible perforations.

3. Remove the syringe from the inflation port, and gently pull on the soft catheter to check that the balloon is securely in the rectum and that it is positioned against the rectal floor. (Figure 6)

4. Position the length of the flexible catheter along patient's leg avoiding kinks and obstruction. Take note of the position indicator line relative to the patient's anus. Regularly observe changes in the location of the position indicator line as a means to determine movement of the retention balloon in the patient's rectum. This may indicate the need for the balloon or device to be re-positioned. In the event of expulsion of the device, deflate the balloon fully; rinse the balloon end of the catheter and reinsert following the instructions for 'Insertion of Device'. A rectal exam should be conducted prior to re-insertion to verify that no stool is present. If expulsion continues for more than three episodes discontinuation of the device should be considered.

5. Hang the bag by the bead strap on the bedside at a position lower than that of the patient.

**D. Irrigation of the Device**
To irrigate the device, fill the syringe with water at room temperature, attach the syringe to the **BLUE irrigation/medication port (marked "IRRIG./Rx" Figure 7-1a) and slowly depress the plunger. Clinicians should take extra care to use the blue port only when irrigating. DO NOT irrigate through the white inflation port (marked "≤45ml" Figure 7-1b) as this would lead to over inflation of the retention balloon and the device would not be irrigated as intended.** Repeat the irrigation procedure as often as necessary to maintain proper functioning of the device. Irrigation of the device as described above is an optional procedure for use only when needed to maintain the unobstructed flow of stool into the collection bag. If repeated flushing with water does not return the flow of stool through the catheter, the device should be inspected to ascertain that there is no external obstruction (i.e. pressure from a body part, piece of equipment, or resolution of diarrhea). If no source of obstruction of the device is detected, use of the device should be discontinued.

**E. Maintenance of Device**
Change the collection bag as needed. Discard used bags according to institutional protocol for disposal of medical waste. Observe the device frequently for obstructions from kinks, solid faecal particles or external pressure.

**F. Administration of Medication (Dosage needs to be controlled by physician).**
1. Attach the supplied syringe and flush the irrigation line with 10ml of water.
2. Prepare a new syringe with prescribed medication. Position the cinch clamp loosely on the catheter at the black indicator line. **Connect syringe to the BLUE irrigation/medication port ("IRRIG./Rx" Figure 7-1a) and administer medication. Clinicians should take extra care to use the blue port only when delivering medication. DO NOT administer medication through the white inflation port (marked "≤45ml" Figure 7-1b) as this would lead to over inflation of the retention balloon and the patient would not receive medication as intended.**
3. To ensure delivery of medication into the rectum immediately flush the irrigation line with at least 50ml of water. Tighten the cinch clamp on the catheter to ensure no flow through the catheter (ensure the second notch is engaged; squeeze tightly using forefinger and thumb of both hands to ensure a good seal). Allow the medication to dwell in the rectum for the desired amount of time as dictated by the prescribing physician.
4. Remove the cinch clamp. Attach a new syringe (not supplied) and flush the irrigation line with 10ml of water. Dispose of the syringe according to institutional policy.

**G. Sampling**
To collect a sample from the catheter, open the sample port cap. Press the tip of a Luer-slip syringe through the slit inside of the sampling port to access the interior of the catheter. Withdraw the syringe plunger to collect the sample. Withdraw the syringe and close the sampling port cap.

**H. Removal of Device**
To remove the catheter from the rectum, the retention balloon must first be deflated. Attach the syringe to the white inflation port (marked "≤45ml") and slowly withdraw all fluid from the retention balloon. (Figure 2-1b)

Disconnect the syringe and discard. Grasp the catheter as close to the patient as possible and slowly remove from the anus.
Dispose of the device in accordance with institutional protocol for disposal of medical waste. In the event that the balloon is difficult or impossible to deflate, cut the inflation lumen and drain out the water in the balloon. On no account should the device be removed from a patient with the balloon still inflated.

**General Guidelines**
The device may be changed as needed to perform normal patient assessment.
The device is not intended for use for more than 29 consecutive days.
If the product packaging is damaged, do not use.
The collection bag measuring scale has an accuracy of +/-15% and is for indication purposes only.

If further information or guidance is needed, please contact ConvaTec Inc. at the address below.

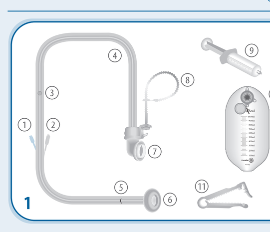
## DEUTSCH



1. Spül- und Medikamentenport
2. Inflationsport mit Signalindikator
3. Probeentnahmeport
4. Katheter
5. Markierungsstrich
6. Niederdruck Retentionsballon mit Fingertasche
7. Konnektor
8. Befestigungsschlaufe
9. Luer-Lock Spritze
10. Auffangbeutel mit Verschlusskappe
11. Katheterklemme

**PRODUKTBESCHREIBUNG**
**Das Stuhldrainage-System Flexi-Seal™ SIGNAL™ besteht aus**
**1 weichen Silikonkatheter, 1 Spritze, 3 Auffangbeuteln mit Filter und, 1 Katheterklemme (Abbildung 1)**

Der weiche Silikonkatheter wird in das Rektum eingeführt, um Stuhl zurückzuhalten und abzuleiten, so dass die Haut des Patienten geschützt und das Bett sauber gehalten wird. Der Silikonkatheter verfügt an einem Ende über einen Niederdruck Retentionsballon, und am anderen über einen Anschluss für den Auffangbeutel. Unter dem Ballon befindet sich eine Vertiefung für den Finger (Fingertasche), damit das System mit dem Finger positioniert werden kann.

An der Katheterseite befinden sich ein weißer und ein blauer Port. Der weiße Port mit dem Aufdruck „45 ml" dient zum Füllen des Retentionsballons nach dem Einführen des Katheters in das Rektum des Patienten (Abb. 2-1b). Dieser Port gibt gleichzeitig ein visuelles- und tastbares Signal, wenn der Niederdruck Retentionsballon optimal gefüllt ist. Der blaue Port mit dem Aufdruck „IRRIG./Rx" dient zum Spülen des Katheters im Bedarfsfall und zur Verabreichung von Medikamenten nach ärztlicher Verordnung (Abb. 2-1a).

**Vorgesehener klinischer Nutzen**
Wie anhand der verfügbaren Daten ermittelt, hat die Flexi-Seal™ FMS-Produktfamilie folgende klinische Vorteile:
- Aufnahme und Ableitung von Stuhl
- Die Möglichkeit, Medikamente verabreichen zu können

**Anforderungen**
Zusätzlich zu den Sicherheits- und Leistungsanforderungen in Bezug auf die sichere Verwendung des Produkts umfassen die Leistungsanforderungen für das Produkt:
- 5 Jahre Produkthaltbarkeit
- Der Auffangbeutel muss ein Fassungsvermögen von 1 Liter haben.
- Der Auffangbeutel muss eine Volumenskala von 100 ml bis 1.000 ml mit einer Genauigkeit von ± 15 % haben.

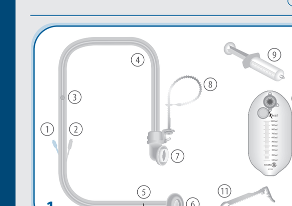
**INDIKATIONEN**
Für das Management von Stuhlinkontinenz durch Ableitung von flüssigem bis halbflüssigem Stuhl sowie als Zugang für die Verabreichung von Medikamenten nach ärztlicher Anordnung.

**KONTRAINDIKATIONEN**
1. Dieses Produkt ist nicht vorgesehen für den Gebrauch:
- über einen Zeitraum von mehr als 29 aufeinander folgenden Tagen.
- bei pädiatrischen Patienten (Patienten unter 18 Jahren), da die Nutzung dieses Produktes nicht an dieser Gruppe getestet wurde.

2. Das Stuhldrainage-System Flexi-Seal™ SIGNAL™ sollte nicht bei Patienten verwendet werden:
- bei denen eine rektale Schleimhautschädigung vermutet wird oder bestätigt wurde (d.h. schwere Proktitis, ischämische Proktitis, Schleimhautulzerationen).
- die innerhalb des vorangegangenen Jahres einer Dickdarm- oder Mastdarmoperation unterzogen wurden.
- die eine Verletzung im Rektum oder Analbereich aufweisen.
- mit ausgeprägten Hämorrhoiden und / oder entsprechender Symptomatik.die eine rektale oder anale Verengung oder Stenose aufweisen.
- bei denen ein Mastdarm/Analtumor vermutet wird oder diagnostiziert wurde.
- bei denen ein Instrument bzw. eine Applikation zur rektalen/analen Anwendung zum Einsatz kommt (z.B. Thermometer, Zäpfchen, Klistier).
- die gegenüber einem der Bestandteile des Systems überempfindlich oder allergisch reagieren

**WARNUNG:**
**Warnung:** Es gibt sehr wenige klinische Studien zur Nutzung von Stuhlableitungssystemen nach 14 Tagen ununterbrochenem Gebrauch.
**Warnung:** Es besteht ein Risiko der Verwechslung mit Konnektoren von anderen medizinischen Produkten wie intravenöse Vorrichtungen, Beatmungssysteme, Harnröhren Produkte, Extremitäten Cuff Inflation rückenmarksnahe Geräte und andere enterale und Magenapplikationen.
Die Nichtbeachtung dieser Gebrauchsanweisung kann die Wahrscheinlichkeit eines unerwünschten Ereignisses erhöhen. Bei der Verwendung des Produkts besteht die Gefahr von Darmobstruktionen.

## ITALIANO



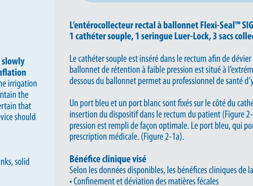
1. Porta di irrigazione ed infusione farmaci
2. Porta di gonfiaggio del palloncino con indicatore del riempimento
3. Porta di campionamento
4. Cannula
5. Linea nera di posizionamento
6. Palloncino di ancoraggio a bassa pressione con tasca digitale
7. Connettore per la sacca
8. Sistema di fissaggio
9. Siringa Luer-lock
10. Sacca di raccolta con tappo integrato
11. Clamp di chiusura

**DESCRIZIONE DEL PRODOTTO**
**Il sistema di gestione dell'incontinenza fecale Flexi-Seal™ SIGNAL™ contiene:**
**1 cannula in silicone, 1 siringa Luer-Lock, 3 sacche di raccolta con filtro, 1 clamp di chiusura (Figura 1)**

La cannula viene inserita nell'ampolla rettale al fine di contenere e allontanare le feci dal paziente proteggendo la cute e mantenendo pulita la biancheria del letto. Ad una delle estremità della cannula si trova un palloncino di ancoraggio a bassa pressione e all'altra estremità un connettore per collegare la sacca di raccolta. Sotto il palloncino di ancoraggio si trova una tasca digitale che consente all'operatore sanitario di posizionare il dispositivo.

Lungo la cannula vi sono due porte di accesso una di colore celeste e una bianca. La porta bianca, contrassegnata dalla scritta "≤45ml", viene utilizzata per gonfiare il palloncino di ancoraggio dopo che il dispositivo è stato inserito nell'ampolla rettale del paziente. (Figura 2-1b) Questa porta bianca di gonfiaggio offre inoltre un'indicazione visiva e tattile per capire quando il palloncino di ancoraggio è adeguatamente riempito. La porta di colore celeste, contrassegnata dalla scritta "IRRIG./Rx" viene usata per irrigare il dispositivo, se ciò è necessario, e per somministrare gli eventuali farmaci prescritti. (Figura 2-1a)

## FRANÇAIS

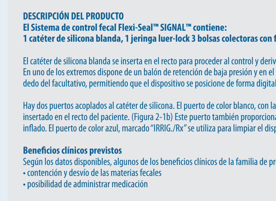


1. Port d'irrigation et d'administration de médicament sur le cathéter
2. Port de gonflage du ballonnet de rétention avec indicateur de remplissage
3. Site de prélèvement
4. Cathéter
5. Ligne indicatrice de positionnement
6. Ballonnet de rétention à faible pression avec encoche pour le doigt
7. Connecteur
8. Sangle de fixation
9. Seringue Luer-Lock
10. Sac collecteur avec bouchon intégré
11. Pince de clampage

**L'entérocollecteur rectal à ballonnet Flexi-Seal™ SIGNAL™ se compose des éléments suivants : (Figure 1)**
**1 cathéter souple, 1 seringue Luer-Lock, 3 sacs collecteurs avec filtre, 1 pince de clampage**

Le cathéter souple est inséré dans le rectum afin de dévier et de contenir les matières fécales de manière à protéger la peau du patient et à maintenir la literie propre. Un ballonnet de rétention à faible pression est situé à l'extrémité distale et à l'autre extrémité se trouve un connecteur permettant de fixer un sac collecteur. Une encoche en dessous du ballonnet permet au professionnel de santé d'y glisser son doigt et de positionner le dispositif manuellement.

## ESPAÑOL

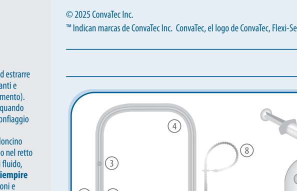


1. Puerto de irrigación y administración de medicación
2. Puerto de inflación del balón de retención con indicador del inflado.
3. Puerto para toma de muestras
4. Catéter de silicona
5. Línea indicadora de posición
6. Balón de retención de baja presión con hendidura digital de inserción
7. Conector
8. Tira de sujeción
9. Jeringa Luer-Lock
10. Bolsa colectora con tapón integrado
11. Pinza de cierre

**DESCRIPCIÓN DEL PRODUCTO**
**El Sistema de control fecal Flexi-Seal™ SIGNAL™ contiene:**
**1 catéter de silicona blanda, 1 jeringa luer-lock 3 bolsas colectoras con filtro, y 1 pinza de cierre (Figura 1)**

El catéter de silicona blanda se inserta en el recto para proceder al control y derivación del contenido fecal, con el objetivo de proteger la piel del paciente y mantener la zona limpia y seca. En uno de los extremos dispone de un balón de retención de baja presión y en el otro, de un conector para acoplar la bolsa colectora. Hay una hendidura debajo del balón para insertar el dedo del facultativo, permitiendo que el dispositivo se posicione de forma digital.

## PORTUGUESA



1. Porta para irrigação do catéter e administração de medicação.
2. Porta de enchimento do balão com indicador de enchimento
3. Porta para colheita de amostras
4. Catéter de Silicone
5. Linha indicadora de posição
6. Balão de retenção de baixa pressão com bolso azul
7. Conector
8. Tira para pendurar o dispositivo
9. Seringa Luer-Lock
10. Saco colector com tampa integrada
11. Pinça de clampagem

**DESCRIÇÃO DO PRODUTO**
**O Sistema de Controlo Fecal Flexi-Seal™ SIGNAL™ contém:**
**1 Catéter de silicone com globo de retenção, 1 Seringa Luer-lock, 3 Sacos colectores com filtro, 1 pinça de clampagem (figura 1)**

O catéter flexível de silicone é introduzido no recto para recolha e desvio das fezes, com o objectivo de proteger a pele do doente e manter a cama limpa. Há um balão de retenção de baixa pressão na extremidade distal, e na outra extremidade, um conector para o saco colector. Existe também um bolso de cor azul, por baixo do balão de retenção, para colocação do dedo, permitindo a introdução digital do dispositivo.

## DANSK

1. Irrigations- og medicinport
2. Inflationsport med fyldningsindikator
3. Prøvetagningsport
4. Kateter
5. Indikatorlinje
6. Lavtrykscuff med fingerlomme
7. Konnektor
8. Ophæng
9. Luer-lock sprøjte
10. Opsamlingspose med integreret lukkeanordning
11. Lukkeklemme

**PRODUKTBESKRIVELSE**
**Flexi-Seal™ SIGNAL™ fækalkatetersystem indeholder:**
**1 blødt kateter, 1 Luer-lock sprøjte, 3 opsamlingsposer med filter , 1 lukkeklemme (Figur 1)**

Det bløde kateter indføres i rektum for at opsamle og bortlede afføring samt beskytte patientens hud og holde sengelinnedet rent. Der sidder en lavtrykscuff i den distale ende og en koblingsring til påsætning af opsamlingsposen i den anden ende. En fingerlomme under cuffen gør det muligt for klinikeren at positionere kateteret med fingeren.

## SUOMI

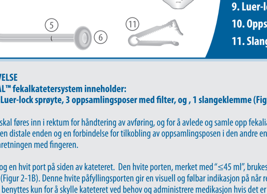
11. Katetrin sulkija

**TUOTTEEN KUVAUS**
**Flexi-Seal™ SIGNAL™ –ulosteenhallintajärjestelmän osat:**
**1 pehmeä katetri , 1 Luer-lock –ruisku , 3 keräyspussia suodattimella, ja 1 katetrin sulkija (Kuva1)**

Pehmeä katetri asennetaan peräsuoleen ulosteen hallintaa varten, suojaamaan potilaan ihoa ja vuodevaatteita. Katetrin toisessa päässä on pehmeä matalapainekuffi ja toisessa päässä ulosteen keräyspussi. Katetrin kuffin alapuolella on asettajan sormea varten tasku, jolla katetri voidaan sijoittaa sormen avulla.

## NORSK

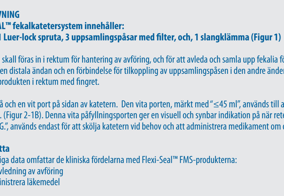


1. Irrigasjons- og medikamentport
2. Port for fylling av ballong med påfyllingsindikator
3. Prøvetakingsport
4. Kateter
5. Posisjonsindikatorlinje
6. Lavtrykkscuff med fingerlomme
7. Sammenkobling
8. Stropp for opphenging
9. Luer-lock sprøyte
10. Oppsamlingspose med integrert lokk
11. Slangeklemme

**PRODUKTBESKRIVELSE**
**Flexi-Seal™ SIGNAL™ fekalkatetersystem inneholder:**
**1 mykt kateter, 1 Luer-lock sprøyte, 3 oppsamlingsposer med filter, og , 1 slangeklemme (Figur 1)**

Det myke kateteret skal føres inn i rektum for håndtering av avføring, og for å avlede og samle opp fekalia for å beskytte pasientens hud og holde sengetøyet rent. Det er en lavtrykksballong i den distale enden og en forbindelse for tilkobling av oppsamlingsposen i den andre enden. Det er et hulrom under ballongen til helsepersonellets finger som gjør det mulig å plassere innretningen med fingeren.

## SVENSK



1. Irrigations- och medikamentport
2. Port för fyllning av ballong med fyllningsindikator
3. Provtagningsport
4. Kateter
5. Positionsindikatorlinje
6. Lågtryckskuff med fingerficka
7. Sammankoppling
8. Upphängningsanordning
9. Luer-lock spruta
10. Uppsamlingspåse med integrerat lås
11. Slangklämma

**PRODUKTBESKRIVNING**
**Flexi-Seal™ SIGNAL™ fekalkatetersystem innehåller:**
**1 mjukt kateter, 1 Luer-lock spruta, 3 uppsamlingspåsar med filter, och, 1 slangklämma (Figur 1)**

Den mjuka katetern förs in i rektum för hantering av avföring, och för att avleda och samla upp fekalia för att skydda patientens hud och hålla sänglädet rent. Det är en lågtrycksballong i den distala änden och en koppling för uppsamlingspåsen i den andra änden. Det är ett hålrum under ballongen till vårdpersonalens finger som gör det möjligt att placera produkten med fingret.

## NEDERLANDS

9. Spuit met Luer-Lock-systeem
10. Opvangzakje met geïntegreerde dop
11. Sluitclip

**PRODUCTBESCHRIJVING**
**Het fecaal managementsysteem Flexi-Seal™ SIGNAL™ bevat:**
**1 samengestelde katheterslang, 1 spuit met Luer-Lock-systeem, 3 opvangzakjes met filter, en 1 sluitclip (figuur 1).**

De katheterslang wordt in het rectum gebracht. Faecaliën worden opgevangen en weggeleid om de huid van de patiënt te beschermen en het beddengoed schoon te houden. Aan het distale uiteinde bevindt zich een lagedruk-retentieballon, en aan het andere uiteinde kan het opvangzakje door middel van een koppeling worden bevestigd. Onder de ballon bevindt zich een uitsparing, zodat de zorgprofessional met zijn of haar vinger het systeem kan positioneren.
